

Target: Acid Sensing Ion Channels
Format: Targeted Venom Discovery Array

Code: T-VDA^{ASIC}

Product Description

The ASIC (Acid Sensing Ion Channel) Targeted Venom Discovery Array™ (T-VDA^{ASIC}) is specifically designed to maximise discovery of new tools. ASIC channels are important drug targets for neurological disorders, specifically pain. ASIC channel tools from theraphosids (tarantulas) and snakes are the most potent and selective agents currently known. These targeted arrays contain pure venom fractions from 12, 24, 48 or 96 species optimised for identification of novel tools. Each array contains characterised venoms active at ASIC channels from the literature to act as positive controls. The control venoms for T-VDA^{ASIC} include *Psalmopoeus cambridgei* (Trinidad chevron tarantula) which contains **Psalmotoxin**, a selective blocker of ASIC1a channels¹; *Dendroaspis polylepis* (Black mamba) venom which contains **Mambalgins** that block ASIC1a/2a heteromers²; and *Dendroaspis angusticeps* (Eastern green mamba) venom which contains mambalgin-3 that blocks ASIC1a and ASIC1b channels as well as 1a/2b heteromers³. Other venom fractions making up the library have been specially selected by our drug discovery scientists to maximise novel hit potential.

- Venoms are supplied lyophilised in Echo[®] qualified acoustic source plates (Labcyte Inc) and are useable on any SBS footprint liquid handling device or by hand.
- 384-well format has 1µg venom fraction per well, re-suspension with 30µl will produce ~1.6µM-16µM stock concentration of peptides.
- 1536-well format has 300ng venom fraction per well, re-suspension with 10µl will produce ~1.5µM-15µM stock concentration of peptides.
